

Software Defined Radio

CONSUMER SOLUTION

Software Defined Radio will also become the next generation of mobile communications at the consumer level as well as PTT technology integration for family and 2-way personal radio applications.

NetworkAnatomy has developed a prototype of their Wristlet communications which is water resistant and includes the 2-way radio, cellular phone, a built in LED light and an 8 decibel panic alarm, which goes off just by squeezing your wrist, guaranteed to ward off anyone. This working prototype was recently displayed during the runway displays at the "Fashion in Motion" segment of the CTIA 2005 show.

NetworkAnatomy is a leading innovator and developer of converged interoperable systems that now include software defined radio (SDR). We have built an engineering platform called IICEBOX™ and a delivery vehicle of Wireless-ICE™ that allows our work to focus on the intended application to meet workforce or individual needs, and then deliver them, through our rapid prototyping architecture to assure a time to market entrance of always less than 12 months. Our Wireless-ICE consumer systems present the convergence of Information, Communication, and Entertainment.
